PIPE TECH – One-Pager

What do we do?

We develop custom software for companies looking to digitize their processes, automate tasks, and improve access to their data. We create solutions tailored to each organization's real operations, integrating technologies like automation, bots, and artificial intelligence only when they provide tangible value.

Who is it for?

Companies that need technology tools aligned with their business logic. Ideal for organizations that already have systems in place (ERP, CRM, databases) but struggle to modernize, integrate, or make them more accessible to users.

The problem we solve

Many companies face manual processes, outdated systems, or valuable data that is not easily accessible. This leads to inefficiencies, errors, and a heavy reliance on technical teams, limiting operational agility and timely decision-making.

Our solution

-Custom software, developed from scratch or on top of existing systems.
-Automation of critical processes and workflows.
-Integration with current tools (ERP, APIs, CRMs, etc.).
-Access to information through simple interfaces or conversational bots, when it adds value.
-Close implementation and support, with an agile and evolutionary approach.

How we work

-Process and systems analysis
-Functional design and prototyping
-Agile and iterative development
-Implementation, training, and continuous support

Our differentiator

We don't sell generic products. At Pipe Tech, each solution is designed from the ground up to solve a specific problem. We work closely with our clients, understand their processes, and propose technology that adapts to them—not the other way around.
