

We focus on research and development of technological solutions that are sustainable for the environment, people, and our clients' economy.

Sector

- Agricultural technology
- Internet of Things

Service

Hardware + Software
+ Knowledge

Presence

Argentina, Brazil, Uruguay,
Paraguay, Chile, Bolivia,
Spain, among others

Metrics

+100 million hectares mapped
+2800 machines online
+1400 clients

Clients

Problem

Consumer demand is centered on improving food safety and traceability. Society requires the responsible application of crop protection products. New technologies for these products demand precise spraying controls to mitigate misuse risks. Operations are increasingly complex, while specialized labor is increasingly scarce.

Solution

Unimap enables all stakeholders in the chain to monitor, in real time, the performance and quality of field operations.

Our products combine hardware, software, and expert knowledge with a platform that visualizes quality indicators, allowing quick responses or anticipation of problems. This mitigates risks, protects the environment and people, and improves our clients' profitability.

Unimap

A real-time monitoring and assistance system, specialized, autonomous, and compatible with all machines, including aerial and ground sprayers, seeders, harvesters, and fertilizer spreaders.

Sensors, devices, and a central unit are installed on the machines to transform data into actionable knowledge, fostering continuous improvement of processes and supporting all stakeholders in making decisions that positively impact business results.

Value Proposition

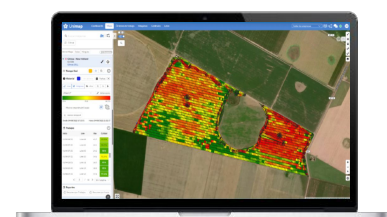

We are leaders in monitoring and assistance systems for agricultural spraying.

Unimap integrates mathematical models and expert knowledge, providing support tools for machine operators, producers, advisors, manufacturers, and communities.

Our platform also enables full carbon offsetting across the entire process.

Our R&D team, together with scientific partnerships, ensures continuous innovation.

Our commitment to triple impact—social, environmental, and economic—is fundamental. We protect workers and urban communities near agricultural areas, minimize crop protection product use through precise management, promote good agricultural practices, and facilitate responsible resource administration.
