

Who are we?

Bactools is a biotech company focused on agriculture. We develop microbiological solutions for sustainable crop production and healthy animal feed.

How do we do it?

We isolate, research, develop, and produce highly resistant spore-forming microorganisms, specifically selected by our scientific team.

Our Purpose

To combat food insecurity and mitigate climate change by making high-impact biological developments available to agricultural, livestock, and dairy producers.

What are Spores?

Bacterial spores are structures containing genetic material that survive extreme conditions (drought, heat, cold) and adverse environments (acidic pH, chemical mixes). They ensure high stability, extended shelf life, and compatibility with other agricultural inputs.

Strategic Joint Venture

Bactools has established a joint venture with Agrefert, a company with over 20 years of experience in the Argentine agricultural sector. This partnership strengthens our development, distribution, and market reach capabilities.
