

Profile

Sector: Biotechnology

Product/Service Type: Fungal

Bioinputs

Founded: 2024

Team Membership: 6

Technology: Agricultural biotechnology based on endophytic and systemic fungi.

Métricas

Metrics

+20 agronomic trials in intensive and extensive crops.

Screening of +500 HE strains.

Proprietary biotechnology platform with scaling and transfer capabilities.

Fungal biotechnology for a more productive and sustainable agriculture.

Company

Biovires S.A. develops biobased inputs using systemic fungi that control pests and stimulate plant growth. It offers sustainable and effective solutions for both specialty and row crops.

Problem & Solution

Agriculture faces resistant pests, ineffective technologies, and growing pressure to produce more sustainably. Biovires addresses these challenges with innovative bioproducts based on endophytic and systemic fungi that control insects from within the plant and boost growth—offering an effective, natural solution aligned with the new demands of modern farming.

Products & Services

Biovires offers microbial bioproducts in wettable powder (WP) formulations, based on endophytic fungal strains with dual action: insect pest biocontrol and plant growth promotion. These products are designed for both specialty and row crops, with high stability, proven efficacy, and strong international registration potential. The company also provides custom development and technology transfer services for agribusinesses seeking differentiated biological solutions with global reach.

Differentiator

Biovires delivers unique bioproducts with dual action: they control pests and stimulate growth from within the plant. Unlike traditional solutions, their systemic and long-lasting effect reduces both costs and application frequency. Trials have shown a 30% increase in biomass and effective control of key insect pests.

Additional Information

Biovires has a proprietary technology platform for strain development, formulation, and agronomic validation, enabling customized solutions for different crops, regions, and market channels. It also offers B2B co-development and licensing services for companies looking to innovate in bioproducts with scientific backing and industrial scalability.

Main milestones of the company
